

GREENDOW

A smart, convenient and energy saving window management option

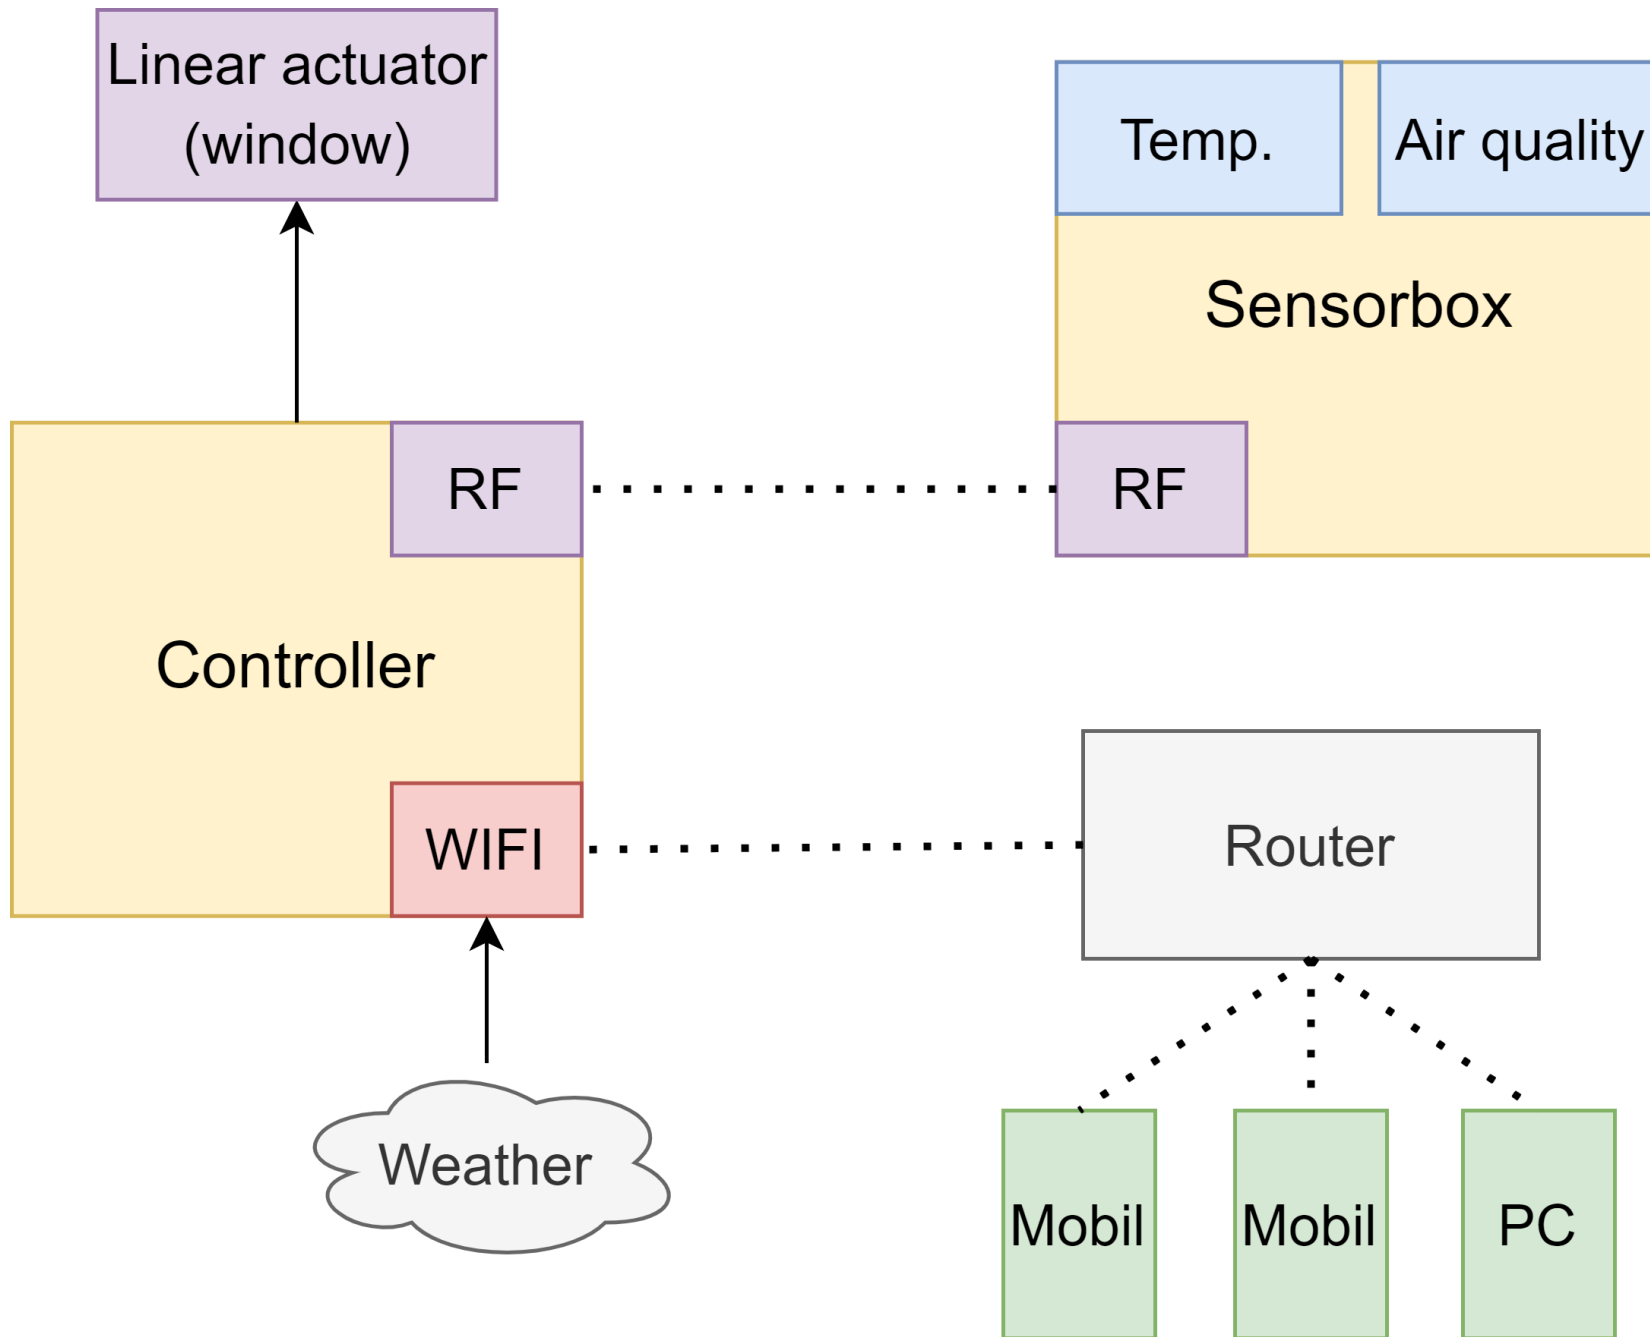

The concept

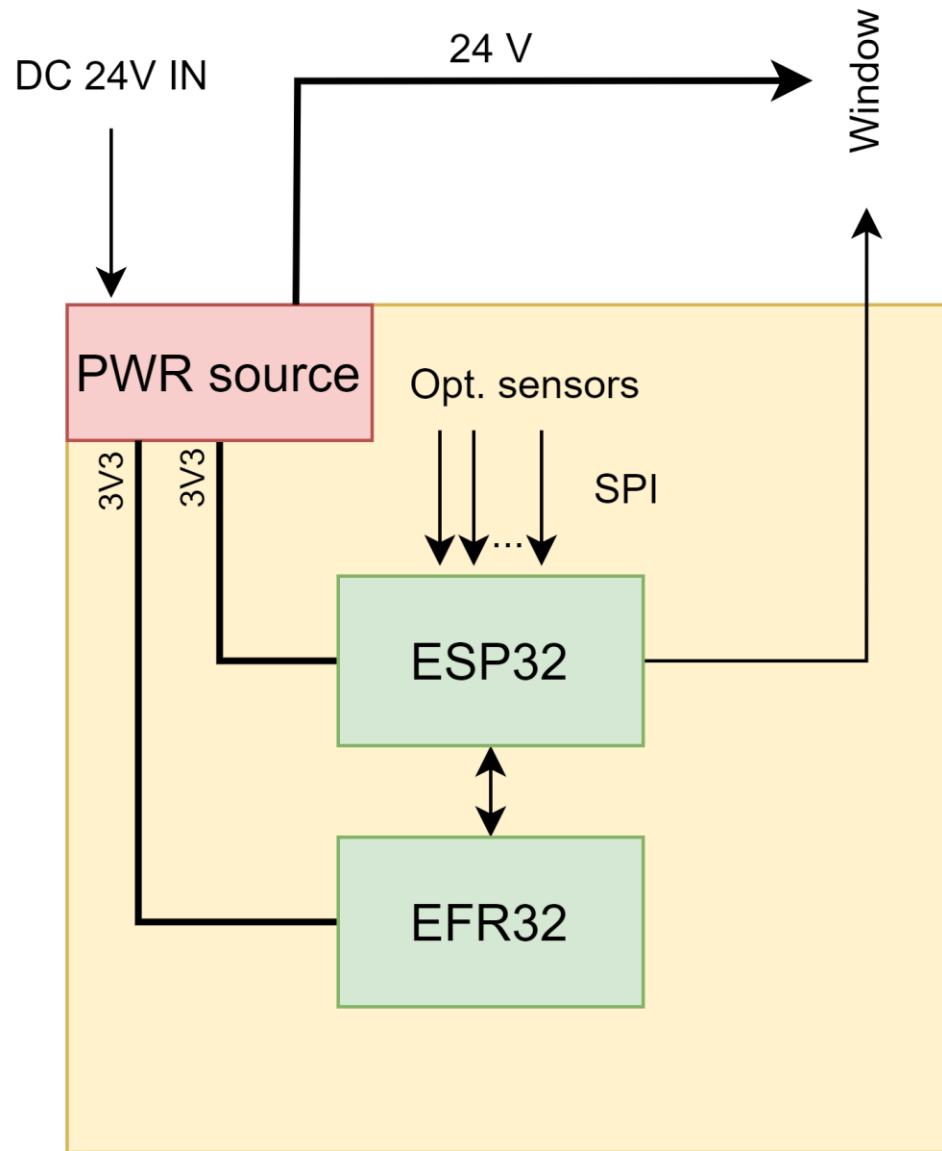

- ▶ We aim to automate opening and closing your window in order to ventilate your room more efficiently
 - ▶ With a smart, scalable, multi-purpose and cost-effective solution
- ▶ When you leave the window open for too long, it wastes a lot of energy
- ▶ Having electrically controllable windows is very fun, but our automation also pays for itself after a while
- ▶ Automated decision with multiple input parameters
 - ▶ Temperature in the room
 - ▶ Air quality in the room
 - ▶ Desired temperature (set by the user or got from an already smart system)
 - ▶ Outside weather (through WiFi)
 - ▶ Example: when it is raining outside (or when it is very cold compared to the desired temp), the device will be much more reluctant to open the window

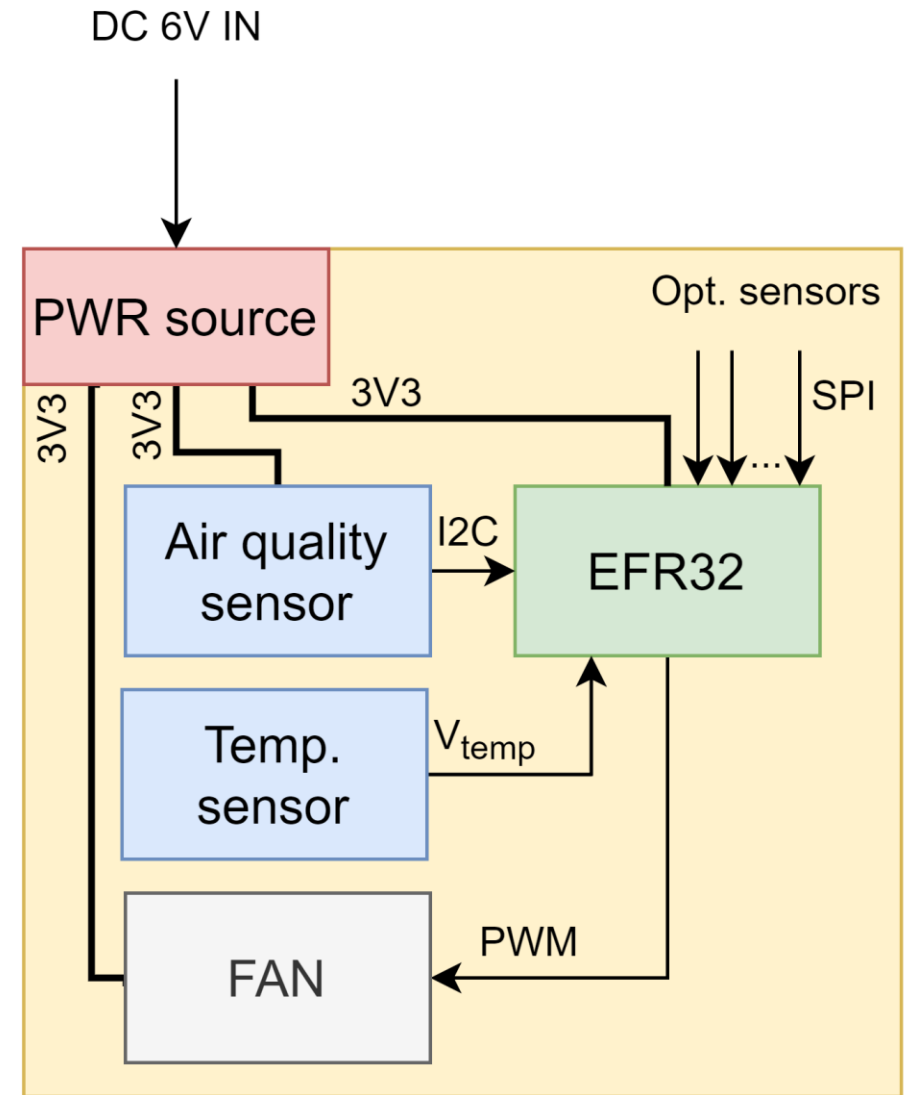

The system itself

- ▶ Two types of devices: a Sensor and a Controller
 - ▶ Sensor: measuring temperature and air quality
 - ▶ VOC sensor (SGP40)
 - ▶ Controller: opening and closing the window and communicating with the outside world through WiFi
- ▶ Comm between devices: 433 MHz (Silicon Labs RF chip)
 - ▶ This is more secure and uses less energy than having WiFi on every board
- ▶ Scalable: you can use any number of devices
 - ▶ One Controller will be the gateway to the outside world through WiFi, everything else is internal communication in the network
- ▶ Expandable: you can add extra sensor through external headers (SPI)
- ▶ Easy to use and integrate: the ESP32 is easily controlled through Home Assistant for example

Controller

Sensorbox

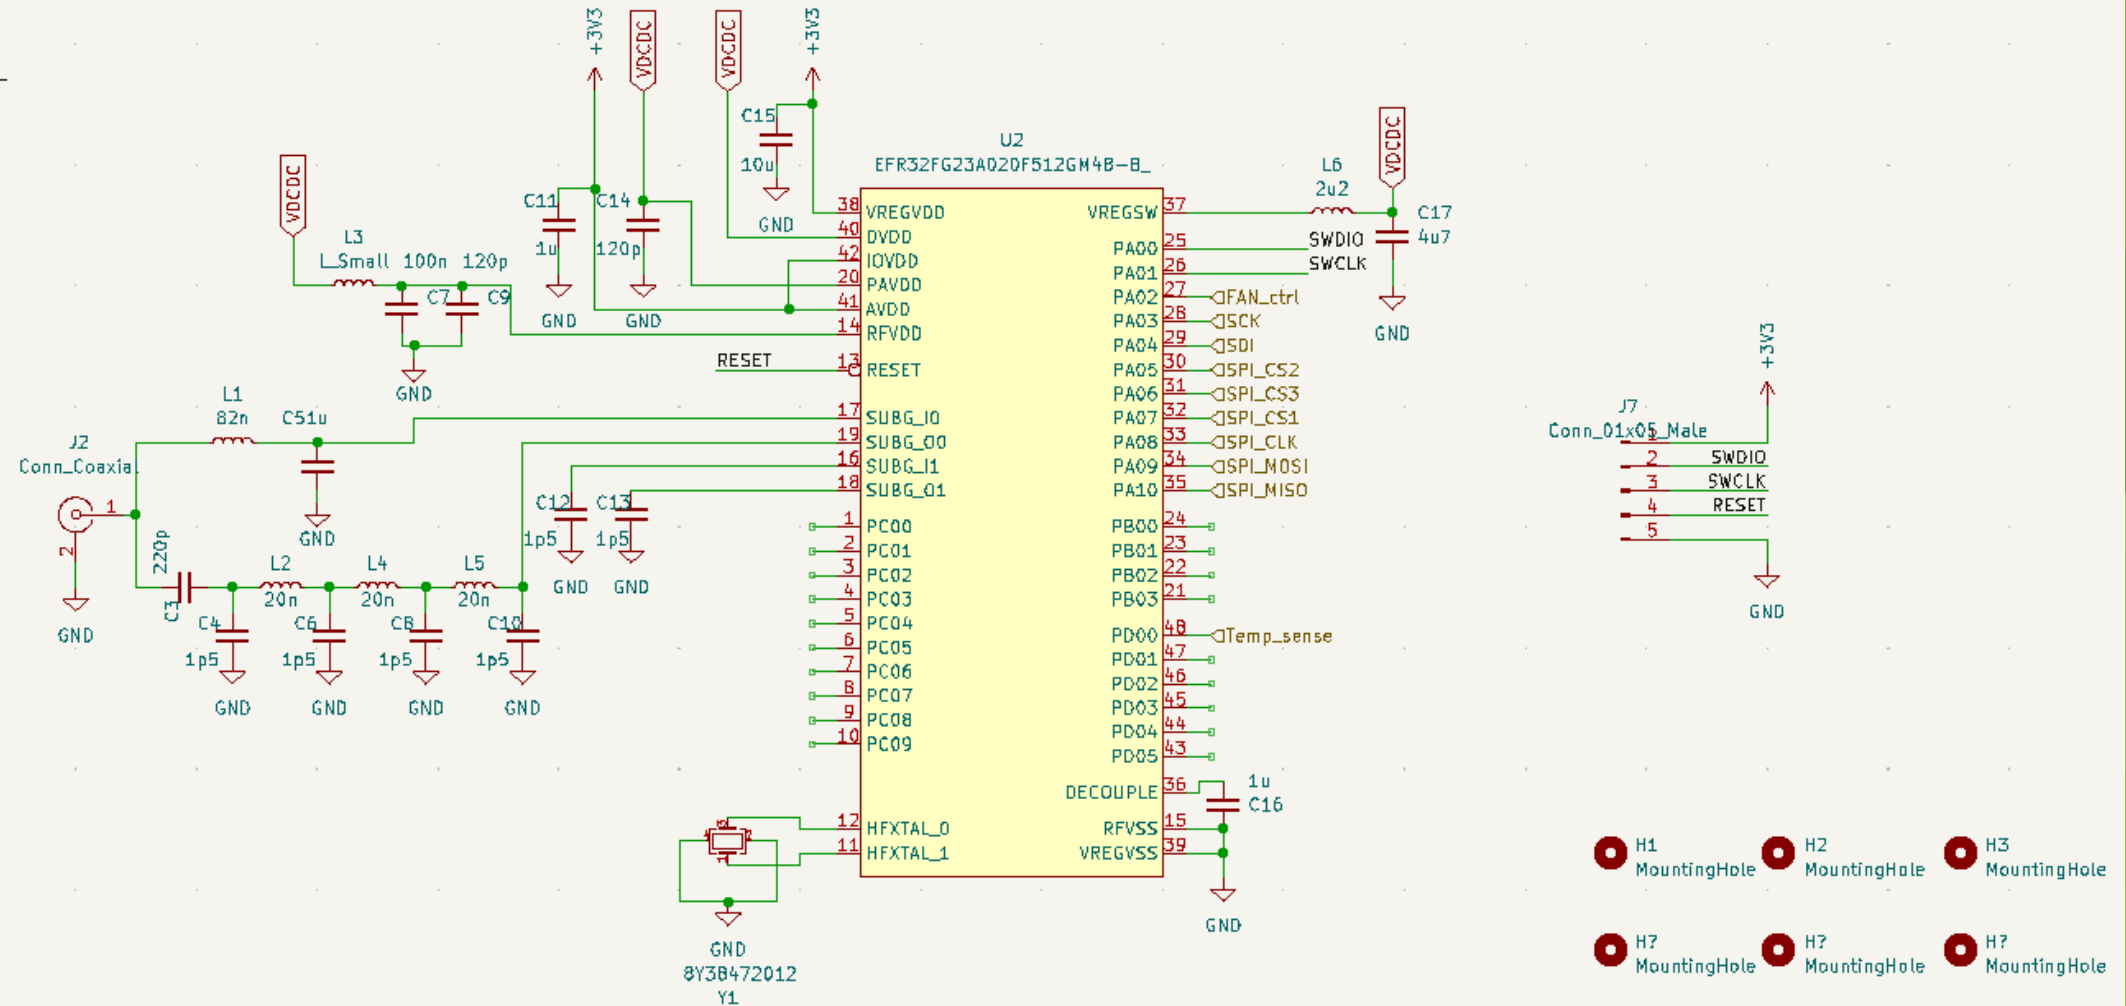

Costs, savings

- ▶ If you can supply power to the window, the installation is basically free
- ▶ The cost of the energy use is close to negligible
 - ▶ Sensor: 4 AAA batteries last for about 2.5-3 months (or plug in)
 - ▶ Controller: consumes about 6 Wh in a day
- ▶ Very rough estimation: you can save around 60-85 EUR per year in a small apartment
 - ▶ Part cost for one pair of devices: 85 EUR
 - ▶ PCB + assembly cost for one pair of devices: 57 EUR
 - ▶ So the system pays back its price in about 2 years
 - ▶ Pretty good investment for a cool home automation project!

Flat size (m ²)	60	Air heat capacitance (kJ/[kg*K])	1,0035	Gas price (EUR/MWh)	250
Flat height (m)	3,5	Air density (kg/m ³)	1,2	Elect. price (EUR/KWh)	
Starting temp. (°C)	22			EUR/HUF	420
Ending temp. (°C)	12			Heating efficiency	0,5
deltaT (K)	10				
volume (m ³)	210				
air mass (kg)	252				
deltaQ (kJ)	2528,82				
deltaQ (kWh)	1,4049				
deltaMoney (EUR)	0,351225				
deltaMoney (Ft)	147,5145				
Estimated savings (HUF/winter)	19 914 Ft	Num. of ventillations per day	1,5		
Est. savings (EUR/winter)	47 €				
Est. savings (HUF/year)	29 872 Ft				
Est. savings (EUR/year)	71 €
